

# Modelling - Tuning

- Tune your model for different types of data

- Depending on what kind of model you're using, will depend on what kind of hyper parameters you can tune.

## Things to Remember

- Machine Learning Models have Hyperparameters you can adjust
- A model first results aren't its last
- tuning Can take place on training or validation data sets
- The goal of tuning hyper parameters is to improve your model's performance, and you should do model
